

Nolco

Flexible protection for heavy and fragile goods

Safe, customer specified and applicable to many requirements

Nolco Industrial Packaging is employed to handle transportation, transit, and storage of heavy and long goods, but is also increasingly used for lighter products when they require a versatile “covering.” They protect goods of the most varied kinds against pressure, shock, impact, deformation, surface damage, and high stacking load.

Nolco products serve as a cover or interlayer, as a backing or partial protection for particularly sensitive sections, and of course as a full-surface cover. They replace a variety of conventional packaging, including wooden boxes, frames and covers, cardboard, and wooden boards. Damage such as cracking and buckling of packaged goods can also be prevented by using Nolco, such as surface damage due to various mechanical and physical influences including blows, bumps, and strapping. Nolco products are therefore effective protection against complaints and the resulting costs.

Depending on requirements, Nolco products can protect individual goods or entire product bundles.

protection of sensitive roll products

protection for long steel rolls

full surface covering of valuable and sensitive components

partial protection of sensitive roll parts

Fast handling guaranteed!

Nolco products facilitate and speed up the packing process. Each Nolco product can easily be adapted regardless of the packaged goods' dimensions. These properties are the result of well-planned combinations of materials. Depending on requirements, Nolco products consist of pressed, hard or soft and correspondingly elastic wood-fiber material, combined with specific inside and outside liners.

solid protection with optimized packing density

horizontal casing of rectangular products

Nolco – form-fitting protection – flexible, endless, rollable, foldable

Nolco-Flex

Shock-absorbing protective covering made of elastic wood-fiber material

Nolco-Flex consists of double-sided laminated soft wood fiber boards in widths available up to 2.40 m. The parallel grooving makes this material flexible and rollable. The required amount gets cut off from an endless roll and fitted as a protective cover to each packaged item separately (for example, coils, rolls, reels, rods, tubes). Nolco-Flex forms a closed protective surface, as an alternative to heavy, splintering wood casing. The elasticity of the material reduces stress from handling and transportation.

Nolco-Rib

Load distributing protective cover made of hard fiber

Nolco-Rib provides similar functionality as Nolco-Flex, but consists of lamellar fiberboard strips. Its strength lies in the greater flexibility and the load distributing effect. The double-sided layer ensures a solid construction. It protects surfaces against shock and impact and can be used for wrapping and bundling of different objects, because of selectable widths of up to 8 m for particularly long goods.

Nolco-Pack

Light and robust top cover and interlayer

Nolco-Pack is the stable, cushioned, and reusable covering and interlayer for all types of coils as an alternative to conventional timber tops. The square cut of the double-sided laminated wood fiber soft boards serves as a lightweight and robust top plate, as well as edge protection for large rollers or cylindrical products stored and transported standing upright.

Nolco-Soft

Surface protection with the protective properties of an outer packaging

Nolco-Soft is a composite made of polyethylene foam and crepe paper. The product is particularly lightweight, tear-resistant, flexible, and cushioning packaging material with the protective properties of an outer packaging. With its 6 mm thick PE foam core, Nolco-Soft conforms to a wide variety of packaging products, including uneven surfaces, for a perfect form fit. Nolco-Soft is easy to cut and can be fastened quickly and easily with tape because of its light weight.

moisture-resistant, climate-resistant

absorbs compressing pressure and protects against deformation

lightweight alternative to heavy wooden frame

form-fit protection for axle supports

intelligent alternative

Nolco-Soft

The advantages at a glance

- “ efficient and flexible packaging protection even with varying dimensions of packaged goods
- “ suitable for heavy, light, bulky, sensitive packaged goods of various shapes
- “ protects against impact, pressure, deformation, surface damage, breakage, and excessive stacking load
- “ has a dampening and load distributing effect
- “ customized additional protection functions (e.g. against moisture and UV exposure)
- “ effortless cutting because of lamellar structure
- “ simple, splinter and nail-free handling
- “ can be sealed and fastened with simple packaging materials
- “ reduced material requirements through flexible adjustment of the dimensions
- “ reduced packaging weight, reduced storage space requirements
- “ reusable
- “ environmentally friendly – products consist predominantly of wood residues
- “ disposal by landfill or incineration
